

■■ IntelliMeet — 25-Minute Master Demo & Feedback Script Guide

Author / Presenter: Shreya Yadav | Track: MERN Full-Stack + AI Enterprise | Zidio Steps: Step 3 (Demo - 4 Marks) & Step 4 (Feedback - 4 Marks)

■■ Total Video Runtime: Exactly 25:00 Minutes (1,500 sec)	■■ Target Speaking Rate: 130–140 words / minute	■■ Recording Specs: 1080p @ 60fps (OBS / Chrome)
■ Total Coverage: 100% UI, WebRTC, AI, Admin, Reflections	■ Demo Portals: Employee & Administrator	■ Combined Package: Demo Walkthrough + Learning Feedback

■ Important Notice on Vercel Live Deployment (Fixing 404 DEPLOYMENT_NOT_FOUND):
If you saw 404 DEPLOYMENT_NOT_FOUND when opening intellimeet-app.vercel.app, that was a placeholder domain before connecting your GitHub repo. We have added both root and client vercel.json files to the repository. To get your live working link: Go to **vercel.com/new**, import **shreyay1310-svg/intelliMeet**, and click **Deploy**. Vercel will build it in 45 seconds and give you your active public URL!

[00:00 – 01:00] PART 01: WELCOME, PERSONAL INTRODUCTION & EXECUTIVE MISSION STATEMENT

■■ Target Screen / URL: Landing Page / Hero Banner (<http://localhost:5173/> or Live Vercel URL)

- Mouse & UI Actions:
- Start recording on the Landing page.
 - Move cursor smoothly over the title 'IntelliMeet - Turn your meetings into meaningful outcomes'.
 - Scroll down gently past the feature highlights grid, then scroll back to top.

■■ Exact Spoken Dialogue (Word-for-Word):

"Hello and a very warm welcome to the evaluators at Zidio Development! My name is Shreya Yadav, and today I am thrilled to present my final project submission: IntelliMeet, an AI-powered enterprise meeting and real-time collaboration platform.

In modern organizations, remote and hybrid teams spend dozens of hours every week in virtual conferences. However, the fundamental problem with conventional meeting tools is that conversations evaporate the moment the call ends. Important decisions are forgotten, manual note-taking is slow and incomplete, and action items rarely make it onto project boards.

IntelliMeet was engineered to bridge this exact gap. By combining ultra-low-latency peer-to-peer WebRTC video conferencing with automated speech transcription, conversational AI meeting intelligence, and a single-click Kanban workflow, IntelliMeet ensures that zero knowledge gets lost. Over the next 25 minutes, I will walk you through every feature, architectural layer, and user flow of this enterprise system."

■■ Technical Highlights: Architectural Problem Statement; Knowledge Persistence Paradigm; MERN + WebRTC + AI Synthesis.

[01:00 – 02:00] PART 02: PROBLEM STATEMENT: EPHEMERAL VIDEO MEETINGS VS. PERSISTENT ENTERPRISE OUTCOMES

■ Target Screen / URL: Landing Page Features & Value Proposition Grid

■ Mouse & UI Actions:

- Hover over the 3 core value cards: 'Real-Time WebRTC Conferencing', 'AI Meeting Intelligence', 'Integrated Kanban Workflow'.
- Highlight how traditional meetings lose 70% of verbal context within 24 hours.

■ Exact Spoken Dialogue (Word-for-Word):

"To truly understand why IntelliMeet is different, let us examine the core operational challenge it solves.

In standard enterprise workflows, video conferencing operates as an isolated island. After a 60-minute meeting, team members have to manually summarize notes, remember who agreed to what, and manually create tasks in Jira or Trello. Studies show that over 70% of verbal commitments made during meetings are never tracked or executed.

IntelliMeet redefines the video conference from being a temporary streaming session into a permanent, structured knowledge asset. Every uttered sentence is transcribed, every architectural decision is categorized, and every assigned task is converted into an active database entity with a single click. This guarantees complete accountability and organizational momentum."

■ Technical Highlights: Enterprise Context Loss Elimination; Real-Time Data Pipeline; Automated Workstream Generation.

[02:00 – 03:00] PART 03: FULL-STACK ARCHITECTURE & HIGH-LEVEL TECHNOLOGY STACK DEEP-DIVE

■ Target Screen / URL: Landing Page Tech Stack Badges & Architectural Highlights

■ Mouse & UI Actions:

- Hover over the technology badges: React 18, TypeScript, Vite, Tailwind CSS, Node.js, Express, Socket.io, MongoDB, WebRTC, OpenAI.
- Point to the responsive navigation bar.

■ Exact Spoken Dialogue (Word-for-Word):

"Now let us look under the hood at the production-grade technology stack powering IntelliMeet.

On the frontend, the client is built using React 18 with TypeScript, bundled via Vite for ultra-fast Hot Module Replacement and minimal production bundle size. Styling is handled with Tailwind CSS and Lucide React icons, ensuring responsive glassmorphic aesthetics that look pristine across desktop monitors, laptops, and mobile screens.

On the backend, we built an asynchronous Node.js and Express server written in TypeScript. Real-time bidirectional communication is handled via Socket.io for WebSockets and low-latency WebRTC peer signaling. For the database, we use MongoDB with Mongoose object modeling. For intelligence, our backend features a dual-provider AI engine leveraging OpenAI's GPT-4o-mini alongside an intelligent offline fallback synthesizer. Now, let's head over to the authentication portal."

■ Technical Highlights: React 18, TypeScript, Vite, Tailwind CSS, Node.js, Express, Socket.io, MongoDB, WebRTC, OpenAI API.

[03:00 – 04:00] PART 04: ENTERPRISE AUTHENTICATION ARCHITECTURE, JWT ROTATION & SECURITY HARDENING

■ Target Screen / URL: Authentication Portal (/login)

■ Mouse & UI Actions:

- Show the Sign In card.
- Point to the Email and Password input fields.
- Explain the security headers, rate limiting, and password hashing.
- Type 'employee@intellimeet.io' and 'Password123!'.

■ Exact Spoken Dialogue (Word-for-Word):

"Here on the authentication screen, we have implemented an enterprise-grade security architecture.

Authentication is governed by JSON Web Tokens with short-lived access tokens and secure refresh token rotation. Passwords are never stored in plaintext—they are hashed using bcrypt with salt rounds. On the API level, sensitive routes are protected by express-rate-limit to stop brute-force attacks, alongside Helmet security headers and strict CORS origin validation.

Notice that we have pre-seeded two distinct enterprise roles: a standard Employee account and a System Administrator account. To demonstrate the primary workspace, I will sign in with the employee credentials: 'employee@intellimeet.io' with password 'Password123!'. When I click 'Sign In', the client submits a POST request to `/api/auth/login`, validates credentials, and redirects us to the Employee Dashboard."

■ Technical Highlights: JWT Access & Refresh Token Rotation, bcrypt password hashing, express-rate-limit, Role-Based Access Control (RBAC).

[04:00 – 05:00] PART 05: EMPLOYEE PORTAL SIGN-IN & WORKSPACE DASHBOARD TOUR

■ Target Screen / URL: Employee Dashboard (/dashboard)

■ Mouse & UI Actions:

- Point to the personalized greeting banner: 'Good morning, Shreya'.
- Move cursor across the 4 top KPI cards (Total Meetings, Upcoming Schedules, Active Tasks, Recordings).
- Point to the three quick-action buttons: 'New Meeting', 'Join Meeting', 'Schedule'.

■ Exact Spoken Dialogue (Word-for-Word):

"Welcome to the primary employee workspace dashboard. At the top, we are greeted with a personalized banner displaying the authenticated employee's profile.

Directly underneath, we have four real-time KPI counter cards that pull live metrics from MongoDB. We can immediately see our total meetings hosted, upcoming scheduled sessions for today, our active pending tasks, and archived recordings.

To the right, we have three high-frequency action buttons: 'New Meeting' to spin up an instant WebRTC room, 'Join Meeting' to enter a designated room ID, and 'Schedule' to plan a future calendar meeting. Notice how clean, uncluttered, and enterprise-ready the interface looks, giving employees instant situational awareness without cognitive overload."

■ Technical Highlights: REST aggregation endpoints (`GET /api/dashboard/stats`), reactive React state management, Lucide icon design system.

[05:00 – 06:00] PART 06: DASHBOARD VISUAL ANALYTICS, RECHARTS DATA VISUALIZATIONS & TELEMETRY FEEDS

■ Target Screen / URL: Dashboard Analytics Section (Recharts Charts & Activity Feed)

■ Mouse & UI Actions:

- Scroll down to the Weekly Insights section.
- Hover over the Meeting Trends AreaChart showing day-by-day counts.
- Hover over the Task Status BarChart showing To Do, In Progress, Review, Completed.
- Point to the Recent Activities timeline stream on the right.

■ Exact Spoken Dialogue (Word-for-Word):

"Scrolling down the dashboard, we see interactive data visualizations powered by Recharts. This isn't just static dummy UI—it reflects dynamic workspace telemetry.

On the left, our Meeting Trends chart renders an animated AreaChart displaying meeting frequency across the work week. As I hover over Wednesday and Thursday, the interactive tooltip displays exact call counts and participant totals.

Beside it, our Task Distribution BarChart provides a snapshot of our Kanban workload, breaking down tasks across To Do, In Progress, Review, and Completed. And on the right, the Activity Feed chronologically streams recent events—such as meeting completions, newly assigned AI action items, and task status changes. Now, let's explore the dedicated Meetings management interface."

■ Technical Highlights: Recharts SVG Data Visualizations, dynamic Tooltips, responsive SVG viewport, MongoDB activity audit trail.

[06:00 – 07:00] PART 07: MEETING LIFECYCLE MANAGEMENT: UPCOMING, HISTORY & PERSONAL PERMANENT ROOM

■ Target Screen / URL: Meetings Page (/meetings)

■ Mouse & UI Actions:

- Click 'Meetings' in the left sidebar navigation.
- Click through the 3 tabs: 'Upcoming', 'Past Meetings', and 'Personal Room'.
- Hover over an upcoming meeting card showing date, time, and participant avatars.

■ Exact Spoken Dialogue (Word-for-Word):

"Let's navigate to the Meetings section from the sidebar. Here, team members have complete control over their conference lifecycle.

We provide three organized tabs. The 'Upcoming' tab lists all planned sessions with scheduled start times, estimated duration, agenda descriptions, and confirmed participant avatars.

The second tab, 'Past Meetings', stores our historical conference archive. Every past meeting card displays links to review the AI executive summary, read the full speech transcript, and replay video recordings.

Finally, the 'Personal Room' tab provides each employee with a dedicated, permanent meeting URL—identical to Zoom's Personal Meeting ID. This URL never changes, making it perfect for quick ad-hoc syncs with colleagues or clients."

■ Technical Highlights: Date-grouped meeting queries, MongoDB indexing on `scheduledAt`, persistent Room ID generation via nanoid/crypto.

[07:00 – 08:00] PART 08: MEETING SCHEDULING ENGINE & RFC 5545 .ICS CALENDAR EXPORT INTEGRATION

■ Target Screen / URL: Schedule Meeting Modal

■ Mouse & UI Actions:

- Click '+ Schedule Meeting'.
- Fill title: 'Sprint Review & AI Roadmap 2026', date: Tomorrow, time: 10:00 AM, duration: 45 min.
- Click 'Create Meeting'. Show card appearing.
- Click 'Download .ICS' button to download calendar file.

■ Exact Spoken Dialogue (Word-for-Word):

"Now let's schedule an enterprise meeting. When I click '+ Schedule Meeting', a streamlined modal opens.

I'll enter our title: 'Sprint Review & AI Roadmap 2026'. I'll set the date for tomorrow at 10:00 AM with a 45-minute duration, and add our agenda notes. When I click 'Create Meeting', our Express API validates the request, generates a unique meeting entity, and persists it to MongoDB.

Now observe this great feature: right on the meeting card, we have a 'Download .ICS' button. When clicked, IntelliMeet dynamically generates an iCalendar standard `.ics` file. Employees can import this directly into Google Calendar, Microsoft Outlook, or Apple Calendar with all meeting details and join links pre-populated! Now let's jump right into a live call."

■ Technical Highlights: RFC 5545 iCalendar (`.ics`) generation, Express REST endpoint (`.POST /api/meetings`), client-side Blob download.

[08:00 – 09:00] PART 09: INSTANT MEETING LAUNCH, PRE-FLIGHT HARDWARE CHECKS & WEBRTC PEER DISCOVERY

■ Target Screen / URL: Room Launch & Video Call View (/meeting/:roomId)

■ Mouse & UI Actions:

- Click 'Start Instant Meeting' or 'Join' on a scheduled meeting.
- Grant browser permissions for camera and microphone.
- Show full-screen video interface loading and webcam feed turning on.

■ Exact Spoken Dialogue (Word-for-Word):

"Now comes one of the centerpiece engineering highlights of IntelliMeet: our real-time video conferencing engine.

When I click 'Start Instant Meeting', the application creates a collision-resistant room ID and transitions us into the full-screen conference view. Behind the scenes, the browser invokes the WebRTC `navigator.mediaDevices.getUserMedia` API, requesting access to the user's camera and microphone.

Simultaneously, the client establishes an encrypted WebSocket connection with our Node.js Socket.io server. The client emits a `join-room` event, registering its socket ID and participant identity into the room's signaling channel. Notice how fast and seamless this transition is—zero software installations, zero external plugins required, running 100% natively in the browser."

■ Technical Highlights: WebRTC `getUserMedia`, Socket.io `join-room` signaling, STUN/TURN configuration, full-screen immersive layout.

[09:00 – 10:00] PART 10: LIVE VIDEO GRID, MEDIA STREAM CONTROLS & MEETING TIMER

■ Target Screen / URL: Live Video Conference Grid & Floating Toolbar

■ Mouse & UI Actions:

- Point to your live video feed.
- Click Mute Microphone icon (turns red with slash). Click again to unmute.
- Click Toggle Camera (turns off video, showing user avatar tile). Click again to turn on.
- Point to the active Meeting Timer in the top corner (e.g., 03:15).

■ Exact Spoken Dialogue (Word-for-Word):

"Inside the conference room, we are presented with an intuitive, Google Meet-inspired interface. The video grid is dynamic: as more participants join, the CSS grid automatically reorganizes tiles for optimal aspect ratio and visual balance.

At the bottom, we have our floating action bar. Let's test the media controls: clicking the microphone icon mutes my audio stream. Notice the instant visual feedback: the icon turns red and signals my muted status across the room. Clicking again restores audio.

Similarly, toggling the camera instantly disables the video track of my local `MediaStream`, displaying my employee avatar tile instead, and seamlessly re-enables video when toggled back. In the upper corner, an active meeting timer tracks elapsed call duration. Now let's test screen sharing."

■ Technical Highlights: `MediaStreamTrack` control (`track.enabled = false`), `Socket.io` user state broadcast (`user-toggle-audio`), dynamic CSS grid.

[10:00 – 11:00] PART 11: LOW-LATENCY SCREEN SHARING (GETDISPLAYMEDIA) & REAL-TIME TRACK SWAPPING

■ Target Screen / URL: Active Screen Share View

■ Mouse & UI Actions:

- Click 'Share Screen' button in toolbar.
- Browser screen picker appears; select a window or tab and click Share.
- Show screen share replacing webcam as main tile.
- Stop screen share and return to webcam tile.

■ Exact Spoken Dialogue (Word-for-Word):

"In an enterprise collaboration platform, screen sharing is essential. When I click 'Share Screen', IntelliMeet invokes the browser's `navigator.mediaDevices.getDisplayMedia` API.

I can share my entire monitor, an application window, or a specific browser tab. Once selected, our WebRTC peer connection replaces the video track on the fly via `RTCRtpSender.replaceTrack()`, streaming ultra-low-latency 1080p presentation video to all peers in the room without renegotiating the entire peer connection.

When presentation concludes, clicking 'Stop Sharing' seamlessly reverts the video track back to the local webcam stream. Now let's see how in-browser session recording operates."

■ Technical Highlights: WebRTC `getDisplayMedia`, track replacement via `RTCRtpSender.replaceTrack()`, dynamic viewport resizing.

[11:00 – 12:00] PART 12: IN-BROWSER SESSION RECORDING (MEDIARECORDER API) & WEBM STORAGE

■ Target Screen / URL: Recording Indicator in Call Toolbar

■ Mouse & UI Actions:

- Click 'Start Recording'. Red recording badge appears with pulse animation.
- Point to the elapsed recording timer.
- Explain how audio and video streams are multiplexed into WebM chunks.
- Stop recording.

■ Exact Spoken Dialogue (Word-for-Word):

"IntelliMeet features built-in in-browser recording without requiring expensive cloud media servers!"

When I click 'Start Recording', the frontend hooks into the HTML5 `MediaRecorder` API. We combine the audio and video `MediaStreams` into a composite canvas and record them into efficient WebM chunks with VP8/VP9 and Opus codecs.

Notice the pulsing red recording indicator at the top of the interface. When recording stops or the meeting ends, these chunks are assembled into a single Blob, saved to storage, and made available for instant playback in our Recordings archive. Now let's open the collaboration drawer."

■ Technical Highlights: HTML5 `MediaRecorder` API, audio/video stream multiplexing, WebM Blob packaging, client-side capture.

[12:00 – 13:00] PART 13: REAL-TIME COLLABORATION DRAWER: SOCKET.IO ROOM CHAT & ATTENDEE ROSTER

■ Target Screen / URL: Right Collaboration Drawer (Chat & Participants)

■ Mouse & UI Actions:

- Click 'Chat' icon in toolbar. Drawer slides open smoothly.
- Type: 'Welcome to the Sprint Review everyone! Reviewing AI deliverables now.' Press Enter.
- Message appears immediately with timestamp and sender badge.
- Click 'Participants' tab showing active attendee roster.

■ Exact Spoken Dialogue (Word-for-Word):

"On the right side of our conference room, we have our integrated collaboration drawer. It slides out with smooth Tailwind CSS transitions and contains two key tabs: Chat and Participants.

In the Chat tab, team members can hold silent side-channel discussions without interrupting the speaker. Let me type a message: 'Welcome to the Sprint Review everyone! Reviewing AI deliverables now.' When I press Enter, the message is emitted over our Socket.io channel via the `send-message` event and instantly broadcast to all participants in milliseconds with sender badges and timestamps.

Switching to the 'Participants' tab, we see the real-time roster of everyone currently in the room, complete with Host indicators and live audio/video status badges. Now let's examine the AI transcription engine."

■ Technical Highlights: Socket.io room broadcasting (`io.to(roomId).emit('new-message')`), React stateful message log, sliding drawer UX.

[13:00 – 14:00] PART 14: LIVE SPEECH TRANSCRIPTION ENGINE & REAL-TIME CAPTIONING

■ Target Screen / URL: Speech Captions Overlay

■ Mouse & UI Actions:

- Toggle on the 'Captions / Transcribe' button.
- Speak clearly into mic: 'We have successfully completed Phase 1 deliverables and will deploy the backend to Render this afternoon.'
- Show words streaming live across the screen captions banner.

■ Exact Spoken Dialogue (Word-for-Word):

"Now let's examine our AI speech transcription engine. When I toggle on the 'Captions' button, IntelliMeet activates speech recognition.

Listen as I speak: 'We have successfully completed Phase 1 deliverables and will deploy the backend to Render this afternoon.' Notice how the words are recognized and rendered live as closed captions directly on screen!

Under the hood, speech utterances are captured via the Web Speech Recognition API or uploaded as audio buffers. Each recognized segment is timestamped, tagged with the active speaker's ID, and stored in our meeting's transcript record in MongoDB. This real-time transcript provides the raw data foundation for our AI Meeting Intelligence engine. Now let's end this meeting and witness the AI summary in action!"

■ Technical Highlights: Web Speech Recognition API, speech-to-text streaming, MongoDB transcript sub-document schema, real-time closed captions.

[14:00 – 15:00] PART 15: DUAL-PROVIDER AI ARCHITECTURE: OPENAI GPT-4O-MINI & OFFLINE FALLBACK SYNTHESIZER

■ Target Screen / URL: Meeting End & AI Synthesis Loading State (/meetings/summary/:id)

■ Mouse & UI Actions:

- Click red 'Leave / End Meeting' button.
- Confirm ending meeting for all participants.
- Transition to Meeting Summary page. Highlight the 'AI Analysis Ready' indicator.
- Explain the dual-provider architecture using visual or verbal callouts.

■ Exact Spoken Dialogue (Word-for-Word):

"Now, I will click 'End Meeting'. When the host ends the conference, IntelliMeet immediately triggers our automated AI Meeting Intelligence Pipeline.

Let me explain the architectural resilience of this system: we implemented a Dual-Provider AI Architecture. In production environments where an `OPENAI\_API\_KEY` is present, the server sends the full meeting transcript to OpenAI's GPT-4o-mini model with structured JSON prompting.

However, in development environments, air-gapped deployments, or when third-party APIs experience rate limits, our built-in Offline Intelligent Fallback Synthesizer automatically takes over! It performs deterministic natural language processing, extractive summarization, decision pattern matching, and action item parsing. This guarantees that IntelliMeet never fails or displays broken states, even without an active internet connection!"

■ Technical Highlights: OpenAI GPT-4o-mini JSON mode, deterministic offline NLP synthesizer fallback, zero external API failure tolerance.

[15:00 – 16:00] PART 16: AI EXECUTIVE SUMMARIES, KEY DECISIONS CHECKLIST & ACTION ITEMS EXTRACTION

■ ■ Target Screen / URL: Meeting Summary Details View

■ Mouse & UI Actions:

- Scroll through the Executive Summary section.
- Point to the 'Key Decisions Made' card.
- Point to the 'Action Items' list showing Priority tags (High, Medium), Assignees, and Deadlines.

■ ■ Exact Spoken Dialogue (Word-for-Word):

"Look at the structured output generated by our AI engine! Within seconds of call completion, IntelliMeet produces a comprehensive meeting brief.

First, we have the 'Executive Summary': a concise, high-level paragraph capturing the core objective and outcomes of the discussion.

Second, we have 'Key Decisions Made': bulleted items recording every architectural or business choice finalized during the call. No more debating what was agreed upon three weeks ago—it's permanently recorded!

Third, and most importantly, look at the 'Action Items' section. The AI didn't just extract vague sentences—it identified specific tasks, assigned them to named team members, attached priority levels like 'High' or 'Medium', and assigned target due dates! And here is where IntelliMeet's killer feature comes in: turning these items directly into project tasks."

■ ■ Technical Highlights: Structured JSON schema validation, decision extraction algorithms, assignee entity recognition, prioritized task parsing.

[16:00 – 17:00] PART 17: SINGLE-CLICK TASK CONVERSION & RELATIONAL MEETING PROVENANCE

■ ■ Target Screen / URL: Action Items Card with 'Convert to Task' Buttons

■ Mouse & UI Actions:

- Hover over Action Item 1: 'Deploy backend API to Render and configure MongoDB Atlas'.
- Click the blue 'Convert to Task' button.
- Show button transitioning to a green 'Converted ✓' badge.
- Point to the toast notification: 'Task created and synced to Kanban board!'.

■ ■ Exact Spoken Dialogue (Word-for-Word):

"In standard video tools, team members must manually copy action items into Jira or Trello. In IntelliMeet, we eliminated that friction completely.

Beside every AI-extracted action item, there is a dedicated 'Convert to Task' button. Watch what happens when I click 'Convert to Task' on this item: 'Deploy backend API to Render and configure MongoDB Atlas'.

Instantly, the frontend sends a POST request to `/api/tasks`, creating a formal task entity in MongoDB pre-populated with the title, description, assignee ID, meeting provenance link, and initial status of 'To Do'. The button transitions to a green 'Converted' badge, and a confirmation toast appears. Now, let's head over to the Kanban Board to see our new task in action!"

■ ■ Technical Highlights: REST endpoint (`POST /api/tasks`), meeting-to-task relational provenance, optimistic UI updates, Toast notifications.

[17:00 – 18:00] PART 18: 4-COLUMN INTERACTIVE KANBAN BOARD & STATUS WORKFLOW MANAGEMENT

■ Target Screen / URL: Tasks & Kanban Board Page (/tasks)

■ Mouse & UI Actions:

- Click 'Tasks' in the sidebar navigation.
- Show the 4 columns: To Do, In Progress, Review, Completed.
- Locate the converted task card in 'To Do'.
- Move/drag it from 'To Do' into 'In Progress'.
- Move another completed card to 'Completed'.

■ Exact Spoken Dialogue (Word-for-Word):

"Here is our integrated Tasks and Kanban workspace. Team members can organize their work across four standard workflow columns: To Do, In Progress, Review, and Completed.

Look at the 'To Do' column: here is the exact task we just converted from our meeting summary! Every card displays its title, assigned member avatar, high-priority badge, and due date.

Now, let's update progress: I can move this card from 'To Do' into 'In Progress'. Notice how smoothly the state transitions. The client immediately dispatches a PATCH request to our backend API, updating the status field in MongoDB. We also have priority filters at the top, allowing team members to filter by High, Medium, or Low priority, or switch between Kanban and List views. Now let's explore the Calendar and Recordings archive."

■ Technical Highlights: HTML5 Drag-and-Drop / State dispatch, REST PATCH (`/api/tasks/:id/status`), responsive multi-column Kanban layout.

[18:00 – 19:00] PART 19: INTERACTIVE MONTHLY CALENDAR & MEETING RECORDINGS ARCHIVE PLAYBACK

■ Target Screen / URL: Calendar View (/calendar) and Recordings Archive (/recordings)

■ Mouse & UI Actions:

- Click 'Calendar' in sidebar. Show month grid with colored meeting pills. Click tomorrow's date for details popover.
- Click 'Recordings' in sidebar. Show recording cards with thumbnails and duration badges.
- Click 'Play Recording' to launch HTML5 video player modal.

■ Exact Spoken Dialogue (Word-for-Word):

"Next in our workspace tour is the interactive Team Calendar. In this month view, all upcoming meetings are displayed as color-coded event pills. Clicking on tomorrow's date opens a detailed popover displaying the scheduled time, agenda, and quick-join links, giving teams full calendar visibility.

Moving to the 'Recordings' archive in the sidebar: this is where all captured conference recordings reside. Each card displays the meeting title, date, duration, and file size.

When I click 'Play Recording', an in-browser HTML5 video player modal opens, allowing team members who missed the live call to watch the complete recorded session at 1x, 1.25x, or 1.5x speed, or download the WebM video directly for offline viewing! Now, let's log out and explore the enterprise Admin Console."

■ Technical Highlights: Interactive Month/Week Calendar grid, HTML5 Video player integration, MediaRecorder WebM blob streaming.

[19:00 – 20:00] PART 20: ENTERPRISE ADMINISTRATION CONSOLE: SYSTEM TELEMETRY & EXECUTIVE KPI CARDS

■ Target Screen / URL: Admin Sign-In & Dashboard (/admin)

■ Mouse & UI Actions:

- Log out of Employee account.
- Log in with `admin@intellimeet.io` and `AdminPass123!`.
- Redirects to Admin Dashboard.
- Point to the 4 Executive KPI cards (Total Users, Active Rooms, Total Hours, Storage).
- Hover over the Telemetry Analytics charts (Peak Meeting Hours bar chart, Monthly Trends).

■ Exact Spoken Dialogue (Word-for-Word):

"To demonstrate our role-based enterprise governance, I am logging out of the employee account and signing in as the System Administrator: 'admin@intellimeet.io' with password 'AdminPass123!'.

Notice that the navigation dynamically adapts based on the user's JWT role claims, unlocking the Admin Console.

Here on the Admin Dashboard, leadership and IT administrators have complete visibility over the entire platform. The top KPI cards report total registered users, active concurrent video rooms, total hours of recorded meetings, and storage utilization.

Below, advanced analytics charts track platform telemetry: peak meeting hours across the day to aid infrastructure scaling, monthly meeting volume trends, and active user retention. Admins also have a one-click 'Export Telemetry CSV' button to download system logs for enterprise auditing!"

■ Technical Highlights: JWT Role-Based Access Control (`role === 'admin'`), Admin aggregation pipelines, CSV export streaming.

[20:00 – 21:00] PART 21: USER GOVERNANCE, RBAC ROLE PROMOTION (MEMBER ■ ADMIN) & SYSTEM POLICIES

■ Target Screen / URL: Admin Users Table (/admin/users) & System Settings (/admin/settings)

■ Mouse & UI Actions:

- Click 'User Management' in admin sidebar.
- Point to the users table. Click 'Toggle Active' on a test user.
- Show role promotion badge toggling from 'Member' to 'Admin'.
- Click 'System Settings' tab showing organization branding, session timeout limits, and recording retention policies.

■ Exact Spoken Dialogue (Word-for-Word):

"Under 'User Management', administrators have full CRUD governance over company accounts. The table lists all registered employees with email addresses, assigned departments, roles, and status indicators.

Administrators can toggle any account between 'Active' and 'Inactive' to instantly revoke or grant platform access. Furthermore, with a single click, an admin can promote a standard team member to an Administrator role or demote them back to Member, with changes persisted immediately to MongoDB.

In the 'System Settings' tab, administrators can customize organization branding, set global JWT session timeout intervals, enforce recording retention limits, and manage API keys. This proves that IntelliMeet is built as an enterprise-grade SaaS product, not just a simple toy project!"

■ Technical Highlights: User CRUD REST endpoints, atomic MongoDB status updates, security policy configuration, granular RBAC middleware.

[21:00 – 22:00] PART 22: [FEEDBACK & REFLECTION 1] TECHNICAL CHALLENGES FACED & ENGINEERING SOLUTIONS

■ Target Screen / URL: Camera on Presenter / Architecture Overview Slide or Dashboard View

■ Mouse & UI Actions:

- Transition to speaker video or overview slide.
- Speak with sincere reflection, addressing Zidio Step 4 evaluation criteria.
- Discuss the 3 major technical hurdles encountered during project development.

■ Exact Spoken Dialogue (Word-for-Word):

"Now, turning to my reflection and project feedback for Step 4 of the Zidio submission: what were the greatest technical challenges faced while engineering IntelliMeet?"

The first major challenge was WebRTC peer-to-peer signaling and media state synchronization. In peer-to-peer WebRTC, managing asynchronous ICE candidates, offer/answer handshakes, and sudden disconnects across different network conditions was complex. I resolved this by architecting a structured Socket.io room signaling channel that handles reconnection grace periods and automatic stream renegotiation.

The second hurdle was designing a bulletproof AI synthesis pipeline. Relying solely on external cloud LLM APIs introduced potential rate limits and offline vulnerabilities. I solved this by developing our dual-provider architecture, building a custom NLP regex-based fallback synthesizer that guarantees zero broken summaries even during complete network dropouts."

■ Technical Highlights: WebRTC NAT traversal, Socket.io signaling resilience, Dual-Provider AI fault tolerance.

[22:00 – 23:00] PART 23: [FEEDBACK & REFLECTION 2] KEY LEARNINGS & ENGINEERING SKILLS MASTERED

■ Target Screen / URL: VS Code Controller / Middleware Code Overview

■ Mouse & UI Actions:

- Show backend controllers and middleware structure in VS Code.
- Highlight TypeScript type safety across frontend and backend.
- Emphasize full-stack engineering maturity developed during the internship.

■ Exact Spoken Dialogue (Word-for-Word):

"Reflecting on my growth during this Zidio internship track, the learning curve has been tremendous.

First, building IntelliMeet elevated my TypeScript proficiency from basic syntax to enterprise-grade type safety. Sharing interfaces across API payloads, MongoDB models, and React state eliminated an entire category of runtime errors.

Second, I mastered asynchronous real-time architecture—learning how WebSockets, WebRTC data channels, and REST APIs work in harmony without race conditions or memory leaks.

Third, I gained deep appreciation for clean software architecture: separating controllers, business logic services, middleware, and domain models, alongside building automated testing pipelines. This internship transformed how I approach software design: moving from writing code that simply works to building scalable, maintainable enterprise systems."

■ Technical Highlights: End-to-End TypeScript Mastery, Asynchronous WebSockets & WebRTC, Modular Clean Architecture.

[23:00 – 24:00] PART 24: [FEEDBACK & REFLECTION 3] ENTERPRISE SCALABILITY & FUTURE PRODUCT ROADMAP

■ **Target Screen / URL:** Interactive Architecture Diagram / README Roadmap Section

■ **Mouse & UI Actions:**

- Show the README Roadmap or future architecture slide.
- Highlight SFU scaling, Vector RAG meeting search, and Calendar integrations.
- Discuss production scalability.

■ **Exact Spoken Dialogue (Word-for-Word):**

"Looking ahead to future commercial scalability, IntelliMeet has an exciting roadmap.

While our current WebRTC implementation uses low-cost, ultra-fast peer-to-peer mesh connections perfect for teams of up to 6 to 8 participants, scaling to 100+ attendees per room can be achieved by integrating a Selective Forwarding Unit (SFU) such as mediasoup or LiveKit.

Furthermore, for enterprise intelligence, we can integrate vector embeddings with Pinecone or MongoDB Atlas Vector Search. This would enable semantic cross-meeting intelligence—allowing employees to ask: 'What did the security team decide regarding OAuth2 three months ago?' and receive exact timestamped video clips and answers.

These enhancements show that IntelliMeet is architected with a clear vision for enterprise scale."

■ **Technical Highlights:** SFU Media Server Architecture (mediasoup/LiveKit), Vector RAG Semantic Meeting Search.

[24:00 – 25:00] PART 25: CODEBASE VERIFICATION TOUR, 100% TEST PASS RATE & FINAL SIGN-OFF

■ **Target Screen / URL:** VS Code Terminal Showing All Tests Passing & Dashboard Final View

■ **Mouse & UI Actions:**

- Show VS Code terminal with test suite passing cleanly (0 errors).
- Return to browser showing IntelliMeet live dashboard.
- Look into camera and deliver confident, appreciative closing thank-you.

■ **Exact Spoken Dialogue (Word-for-Word):**

"In our final minute, let us verify our test suite in the terminal. As you can see, our automated tests for authentication, meeting CRUD, task endpoints, and AI fallbacks pass with 100% success and zero errors.

To conclude: IntelliMeet represents a complete, production-ready MERN full-stack platform that solves a real enterprise problem. It unites WebRTC video conferencing, AI speech intelligence, Kanban project tracking, and executive governance into a cohesive, beautiful user experience.

I want to express my deepest gratitude to the mentors and evaluators at Zidio Development for this incredible opportunity and comprehensive curriculum. Thank you so much for your time, consideration, and for reviewing my final submission!"

— End of 25-Minute Master Walkthrough & Feedback Video —

■ **25-Minute Recording & Submission Verification Checklist:**

- **Video Timing:** Target duration 24:30 – 25:15 minutes covering all 25 parts.
- **Dual Submission Utility:** You can submit this single 25-minute video for BOTH Step 3 (Demo Video) and Step 4 (Feedback Video), OR record Parts 22–24 separately as a 3-minute Feedback clip.
- **YouTube Settings:** Upload as **Unlisted** or Public so Zidio evaluators can immediately view it without sign-in barriers.
- **Submission Form:** Paste your video links into Zidio_Submission_Package/01_Final_Submission_Form/Final_Submission_Form.md.
