

IntelliMeet

Member 2 (Backend) — Complete Installation Guide

AI-Powered Enterprise Meeting & Collaboration Platform | Zidio Development | September 2026

■ Overview

Yeh guide Member 2 (Backend Developer) ke liye hai. Isme sab kuch cover kiya gaya hai — system-level tools se lekar Node.js packages, environment setup, aur server start karne tak. Sab commands copy-paste ready hain.

STEP 1 Prerequisite Software Install Karo (System Level)

Yeh tools ek baar system mein install hote hain. Agar already installed hai toh skip karo.

Software	Version	Download Link (Clickable)	Zaroorat
Node.js	v18+ LTS	nodejs.org/en/download	■ Required
Git	Latest	git-scm.com/downloads	■ Required
VS Code	Latest	code.visualstudio.com	■ Required
Postman	Latest	postman.com/downloads	■ Recommended
MongoDB Community	v7+	mongodb.com/try/download	■ Optional*

■ MongoDB install karna OPTIONAL hai! IntelliMeet project automatically mongodb-memory-server use karta hai local development ke liye — koi alag DB setup ki zaroorat nahi.

STEP 2 Project Clone / Copy Karo

Git repository se project clone karo, ya ZIP extract karke folder mein jaao:

Terminal / PowerShell

```
# Option A: Git se clone karo

git clone https://github.com/your-org/intelliMeet.git
```

```
# Option B: ZIP extract ke baad

cd intelliMeet
```

STEP 3 Root Dependencies Install Karo

Project root folder (intelliMeet/) mein yeh command chalaao:

```
# intelliMeet/ (root) mein

npm install
```

Yeh **concurrently** package install karta hai — jisse ek hi command se frontend aur backend dono chalte hain.

STEP 4 Server (Backend) Dependencies Install Karo

server/ folder mein jaao aur npm install chalaao:

```
cd server

npm install
```

■ Production Dependencies (Auto Install Honge)

Package	Version	Kaam (Purpose)
express	^4.21.2	Web server framework — API routes handle karta hai
mongoose	^8.9.5	MongoDB ODM — database models aur queries
mongodb-memory-server	^10.1.4	Local dev ke liye in-memory MongoDB (no setup needed!)
socket.io	^4.8.1	Real-time WebSocket + WebRTC signaling
jsonwebtoken	^9.0.2	JWT tokens — login/auth ke liye
bcryptjs	^3.0.2	Password hashing — secure storage
dotenv	^16.4.7	.env file se environment variables load karta hai
cors	^2.8.5	Cross-Origin Resource Sharing allow karta hai
helmet	^8.0.0	HTTP security headers automatically set karta hai
express-rate-limit	^7.5.0	API pe rate limiting — DDoS protection
multer	^2.4.0	File/image upload middleware (avatar ke liye)
cloudinary	^2.11.0	Cloud image hosting — avatar upload (optional)
ioredis	^6.0.0	Redis client — future caching (optional)

■ Dev Dependencies (TypeScript Tools)

Package	Version	Kaam (Purpose)
---------	---------	----------------

<code>typescript</code>	<code>^5.7.3</code>	TypeScript compiler — .ts files ko .js mein convert karta hai
<code>tsx</code>	<code>^4.19.2</code>	TypeScript files directly run karne ke liye (dev server)
<code>@types/express,</code> <code>@types/node etc.</code>	Various	TypeScript type definitions — IDE autocomplete ke liye

STEP 5 .env File Banao (Environment Configuration)

server/ folder mein `.env.example` file ko copy karke `.env` banao:

Terminal

```
# Windows (PowerShell)

copy .env.example .env

# Linux / macOS

cp .env.example .env
```

`.env` file mein yeh minimum configuration chahiye:

Variable	Default Value	Note
<code>PORT</code>	<code>5000</code>	Backend server port
<code>NODE_ENV</code>	<code>development</code>	<code>development</code> / <code>production</code>
<code>CLIENT_URL</code>	<code>http://localhost:5173</code>	Frontend URL (CORS ke liye)
<code>MONGO_URI</code>	<code>(khali chhod do)</code>	■ Khali = auto memory DB use hoga!
<code>JWT_SECRET</code>	<code>any_random_string</code>	Koi bhi secret string daal do
<code>CLOUDINARY_*</code>	<code>(optional)</code>	■ Optional — base64 fallback auto-kaam karta hai
<code>OPENAI_API_KEY</code>	<code>(optional)</code>	■ Optional — AI summaries built-in synthesizer se bhi kaam karti hain

STEP 6 Server Start Karo

Ab server chalaane ke liye teen options hain:

Option	Command	Effect
A — Both	<code>cd intelliMeet && npm run dev</code>	Frontend + Backend dono ek saath start
B — Server only	<code>cd server && npm run dev</code>	Sirf backend server (port 5000)
C — Root shortcut	<code>npm run server</code>	Root se sirf server start karo

Server successfully start hone ke baad yeh output dikhega:

Expected Console Output

```
=====

■ IntellMeet Server running on http://localhost:5000

■ WebSocket & WebRTC signaling ready

■ Client URL: http://localhost:5173

=====
```

STEP 7 Verify — Server Kaam Kar Raha Hai Ya Nahi

Browser mein yeh URLs open karke confirm karo ki server live hai:

Check	URL	Expected Response
Health Check	http://localhost:5000/api/health	{ "status": "healthy" }
Auth Test	http://localhost:5000/api/auth/me	401 Unauthorized (correct — no token)
Frontend	http://localhost:5173	IntelliMeet login page

■ Quick Reference — One-Shot Copy-Paste Commands

Agar sirf commands chahiye toh yeh paste karo ek baar:

Complete Setup Commands

```
# Step 1: Root install

npm install

# Step 2: Server install

cd server && npm install

# Step 3: .env banao (Windows PowerShell)

copy .env.example .env

# Step 4: Dono start karo

cd .. && npm run dev

# Verify karo

# Browser open karo: http://localhost:5000/api/health
```
